To get past the 339 errors in Vista

When you start the program you may get an ERORR 339 it will list the component that has caused the problem e.g. sysmon.ocx (not everyone who gets these errors gets the same component)

When you get the error leave it on the screen.

Click Start

In the RUN bar type CMD and press enter or return

This should launch an old fashioned DOS Prompt window.

Note leave space between regsvr32 & the **Note leave space between file name and /u**

Type regsvr32 space the name of the file that has caused the problem space /u

File name with correct spaces without extension.

Press enter or return

You should now get a window saying the file has been unregistered – Click OK

You can now close the original error message.

Try the program again. If you get another error repeat the process till the program launches and each component runs without errors.

If you do not get the window saying unregistered " as above" ---

What you might have to do is -

When you click start & type cmd in the search box, you need to right click on the icon at the top of the list & select RUN AS ADMINISTRATOR.
